

# CSE 211: Microprocessor Based Systems

Sheet 5

# I/O port pins for TM4C123GH6PM microcontrollers.

# Switches and LEDs on Tiva C Board

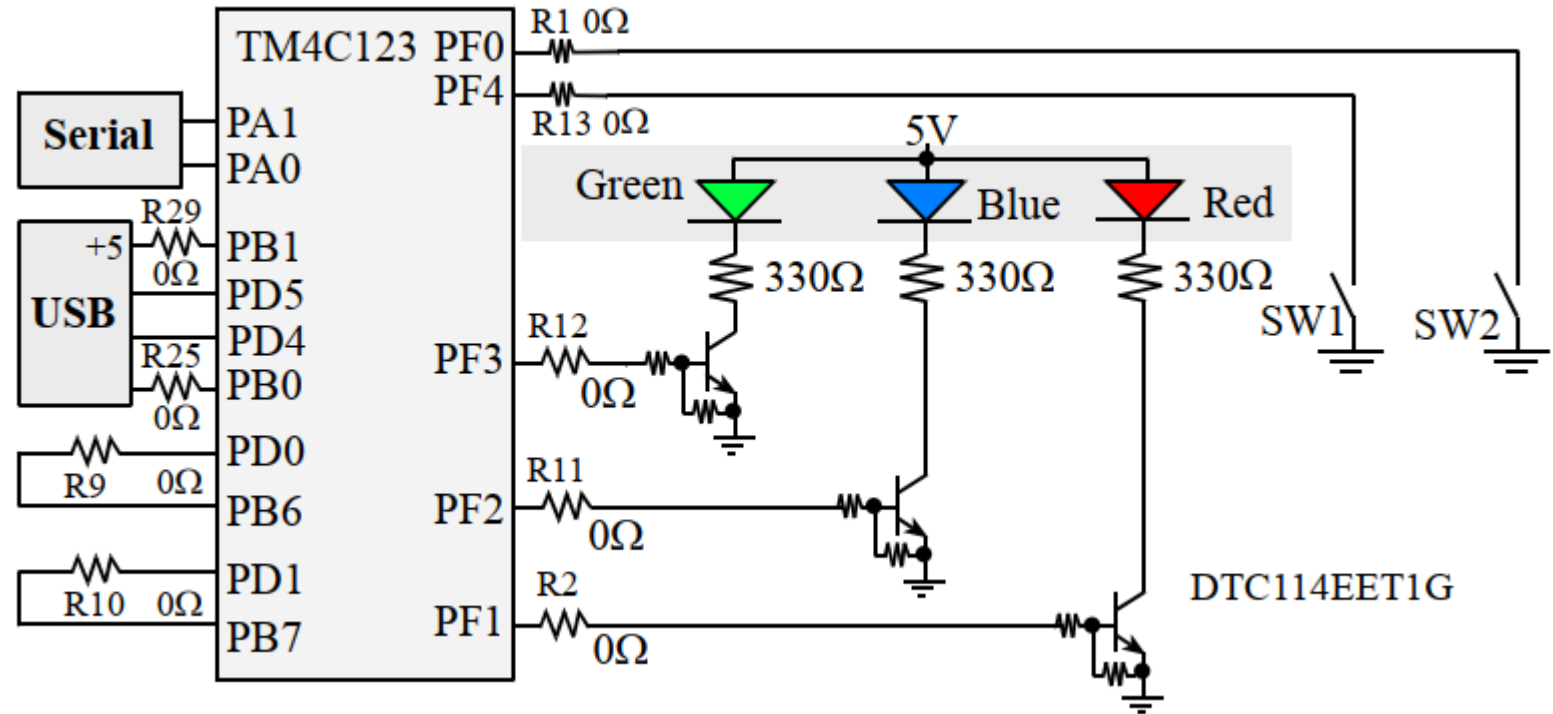

TIVAC LaunchPad has

- Two build-in switches:

1. SW 1 (PF4)
2. SW 2 (PF0)

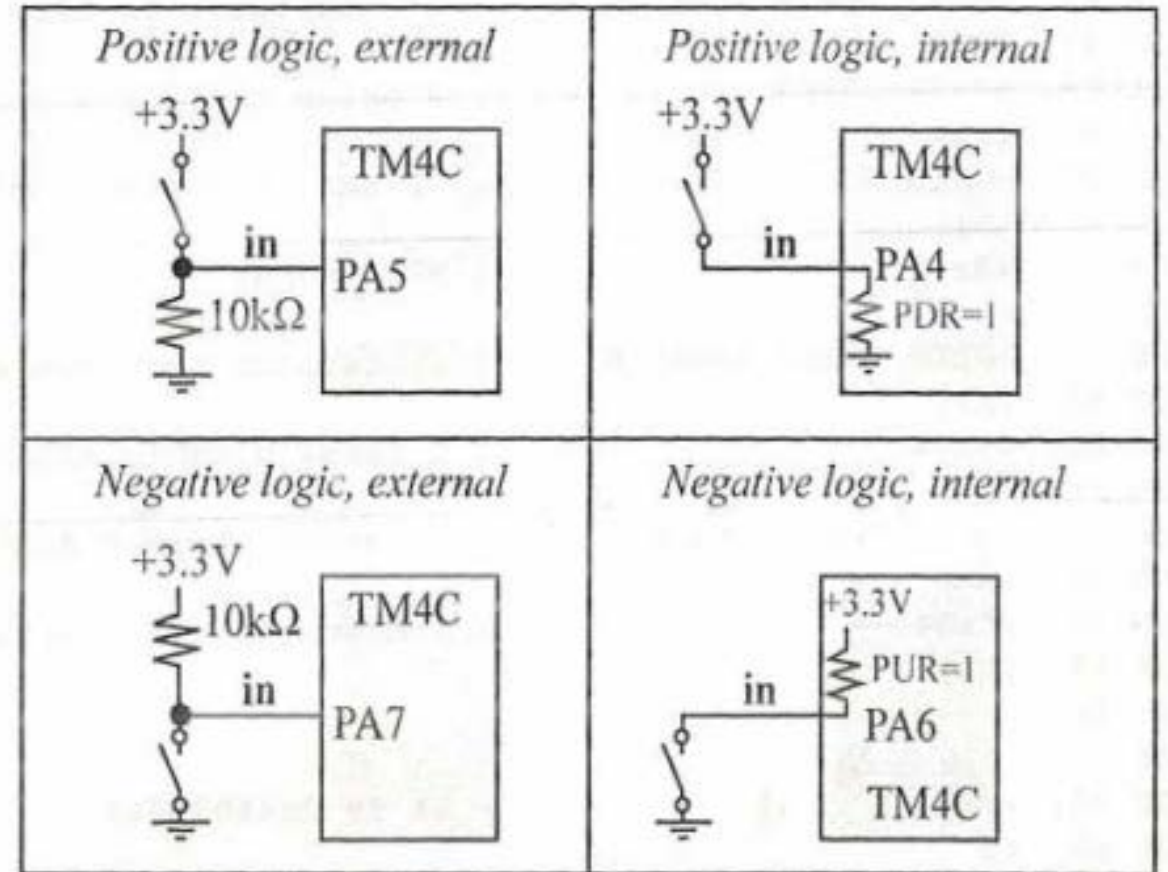

- Three LEDs:

1. Red (PF1)
2. Blue (PF2)
3. Green (PF3)

# Switch Interfacing

- The switches are negative logic and will require activation of the internal pull-up resistors.
- You will set bits 0 and 4 in GPIO\_PORTF\_PUR\_R register.
- The LED interfaces on PF3 – PF1 are positive logic.
- To use the LED, make the PF3 – PF1 pins an output.
- To activate the red color, output a one to PF1.
- The blue color is on PF2, and the green color is controlled by PF3.

# Switch Debouncing

- Mechanical switches may bounce when changing state
- We debounce the switch using time delay

Figure 1

# LED Interfacing

# Registers of Ports

- **GPIO\_PORTF\_DIR\_R**: it sets the direction register to specify which pins are input and which are output.
- **GPIO\_PORTF\_AFSEL\_R**: to activate the alternate functions.
- **GPIO\_PORTF\_DEN\_R**: to use a pin as a digital input or output.
- **GPIO\_PORTF\_AMSEL\_R**: To use a pin as an analog input.
- **SYSCTL\_RCGCGPIO\_R**: Each of the ports has a clock, which can be separately enabled by writing to it.
- **SYSCTL\_PRGPIO\_R**: Because it takes time for the clock to stabilize, we will wait for its status bit in the PRGPIO to be true.

# Configurations of Ports

- PCTL values

- Each pin also has four bits in the **PCTL** register, which we set to specify the alternative function for that pin (0 means regular I/O port).

# GPIO Activation

- To activate a GPIO port for digital I/O, we need to do 7 steps
- 1. Activate the clock RCGCGPIO and wait for its status bit in PRGPIO
- 2. (optional) Unlock pins PD7 and PF0
- 3. Disable the analog function AMSEL\_R
- 4. Disable alternate function AFSEL\_R
- 5. Enable digital port DEN\_R
- 6. Clear PCTL\_R to select digital function (4 bits/pin)
- 7. Set direction register DIR\_R (0 for In, 1 for out)

# Activation Example

- Code Example to initialize Port F for regular digital I/O. Bits 0 and 4 as input, Bits 1 -3 as output ( Tiva C: Switches and LEDs)

```
19 void initPortF() {  
20     SYSCTL_RCGCGPIO_R |= 0x20;           // 1) activate clock for Port F  
21     while((SYSCTL_PRGPIO_R & 0x20) == 0); // wait for stabilization  
22  
23     GPIO_PORTF_LOCK_R = 0x4C4F434B; // 2) unlock GPIO Port F  
24     // Set bits GPIO_PORTF_CR_R to determine which bits are committed  
25     // This register prevents accidental programming of the registers that control  
26     // connectivity to the NMI and JTAG/SWD debug hardware  
27     GPIO_PORTF_CR_R = 0x1F;           // allow changes to PF4-0  
28  
29     GPIO_PORTF_AMSEL_R = 0x00;        // 3) disable analog on PF  
30     GPIO_PORTF_PCTL_R = 0x00000000; // 4) PCTL GPIO on PF4-0  
31     GPIO_PORTF_DIR_R = 0x0E;         // 5) PF4,PF0 in, PF3-1 out  
32     GPIO_PORTF_AFSEL_R = 0x00;       // 6) disable alt funct on PF4-0  
33     GPIO_PORTF_DEN_R = 0x1F;         // 7) enable digital I/O on PF4-0  
34  
35     GPIO_PORTF_PUR_R = 0x11;         // enable pull-up on PF0 and PF4 for SW  
36 }
```

## Setting UART in port E

- Use UART7 on pins PE0 and PE1
- Set bits 1,0 in the DEN register (enable digital)
- Clear bits 1,0 in the AMSEL register (disable analog)
- Write a 0001,0001 to bits 7–0 in the PCTL register (enable UART7 functionality)
- Set bits 1,0 in the AFSEL register (enable alternate function)

## Sheet 5 Q.1

Write an assembly function that initializes port F pins 1, 2, and 3 as Digital Output with initial zero values.

## Sheet 5 Q.2

- Write an assembly function that initializes port F pin 4 as Digital Input that will be connected to a switch.

## Sheet 5 Q.3

- Write an assembly function that reads PORTF pin4.

## Sheet 5 Q.4

Write an assembly function RGB\_Output that clears pin1, pin2 and pin3 of PortF then writes the value of R0 to pin1, pin2 and pin3 of PORTF.

# Sheet 5 Q.6

Repeat previous questions using C

## Sheet 5 Q.5

In Tiva C, PF4 is connected to a push button and PF1, PF2, and PF3 are connected to an RGB LED. PF1 is red, PF2 is blue, and PF3 is green. Write assembly application that uses the init functions developed in previous questions. The application reads input from the switch and when it is pressed for the first time the red LED should be turned on then when pressed a second time turn off the red LED and turn on the blue LED then when pressed a third time turn off the blue LED and turn on the green LED then when pressed a fourth time turn off the green LED and turn on again the red LED and then repeat the cycle.
