

# UI, UX and Design Thinking

CSE608

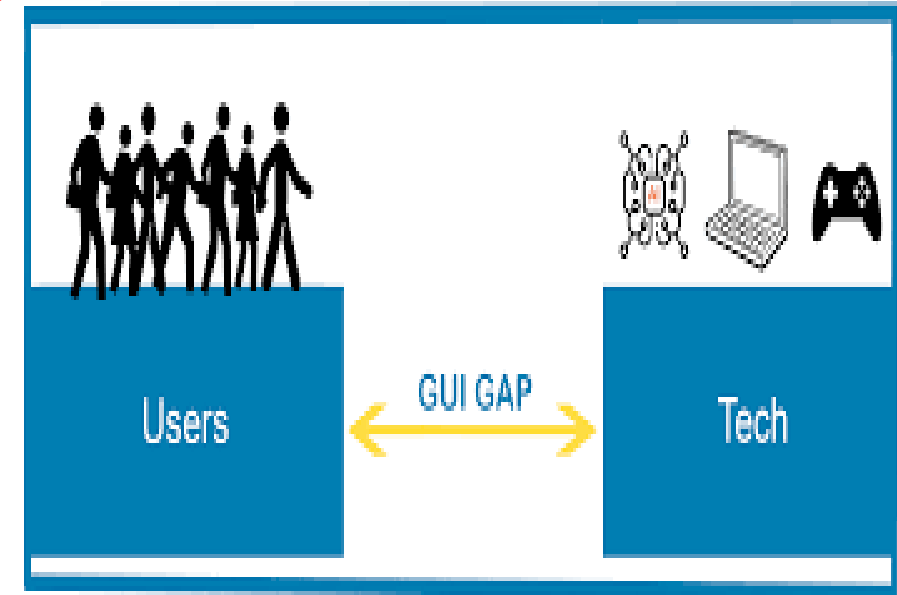

Advanced Software Engineering

Dr Islam ElMaddah

# Why UI?

- Good UIs are critical to success
- UI programming is
  - easy (sophisticated algorithms not required)
  - straightforward (can immediately correct mistakes)
  - fun (results are immediately visible)
  - rational (apply simple rules)
- UI design is not graphic design

common  
USEFUL

# Cardinal axiom

- “A user interface is well-designed when the program behaves exactly how the user thought it would.” – Joel Spolsky
  - user is happy = user in control = S/W correctly interprets user’s actions
  - loss of control → depression, frustration (“Learned Helplessness” [Seligman])
- All the other rules are just corollaries:

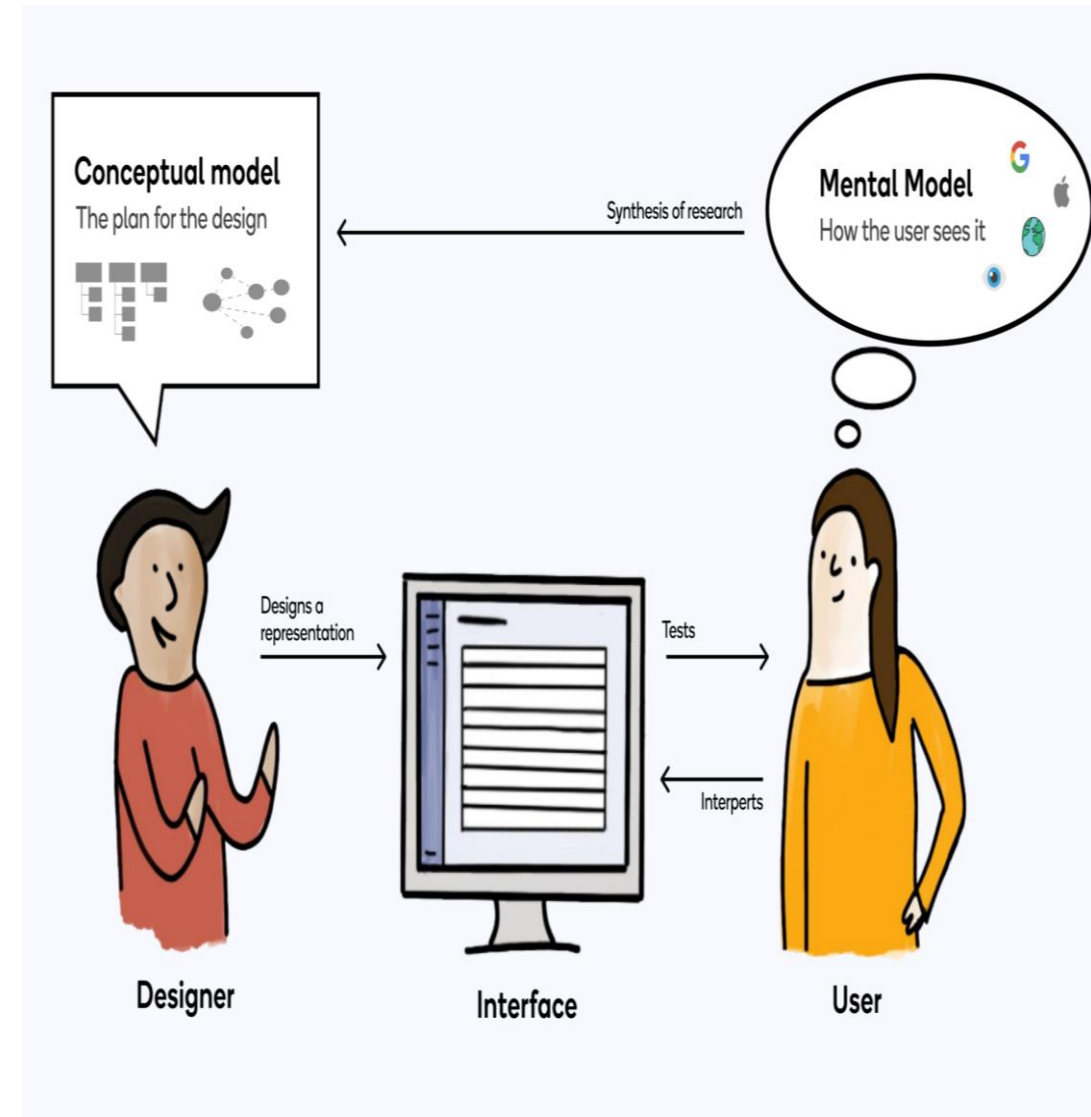

Golden rules: place user in control,  
reduce user’s memory load,  
make interface consistent

**GOLDEN  
RULE**

# User and program models

- User model: User's idea of what's happening
- Program model: Program's idea of what's happening (i.e., what's *actually* happening)
- Successful UI when program model corresponds to user model
  - Speak user's language
  - Follow real-world conventions, make information appear in natural and logical order
  - Use metaphors from real world

# Example

<img ->

<img>

- Pictures in documents are
  - *embedded* in word processor (e.g., Word)
  - *not embedded* in HTML
- With **WYSIWYG** HTML editor (e.g., FrontPage), what do you do?
  - change user model (describe in manual, explain with popup dialog box)
  - change program model (make copy of picture in subfolder)

# How do you get the user model?

Ask the users!

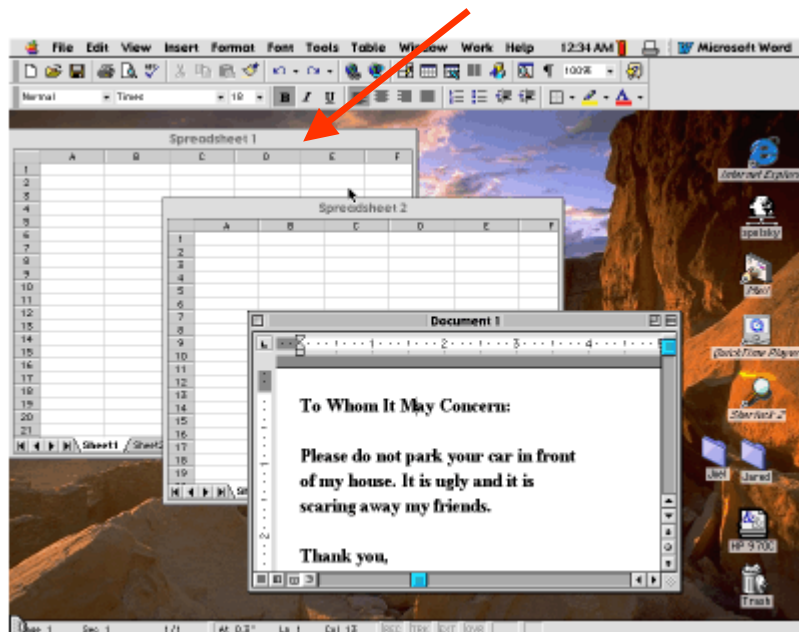

## The 50-cent usability test

- Usually 5-6 people is enough, will start to see consensus
- Don't need formal usability lab, or "people off the street"
- Just sketch or prototype and ask your neighbor

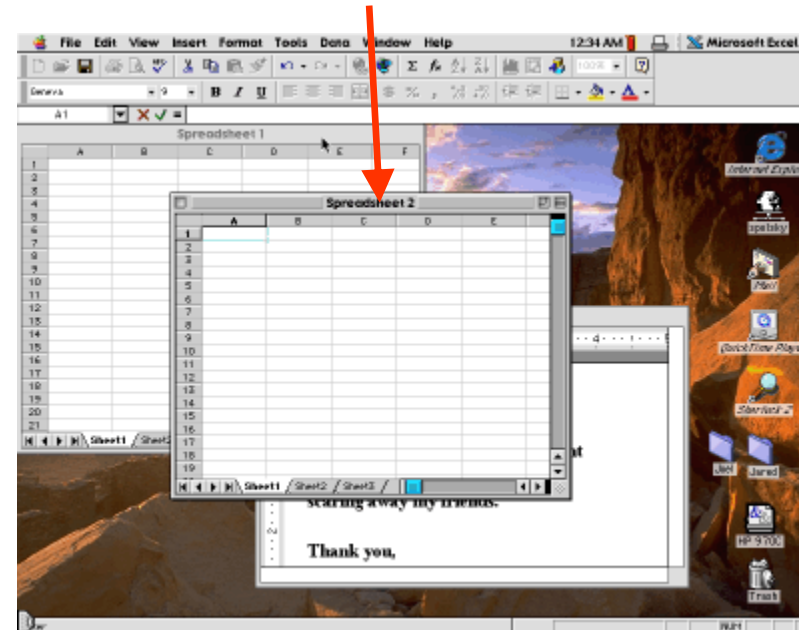

# User models are simple

- If your program model is nontrivial, it's probably wrong

Click here

This window comes to top!

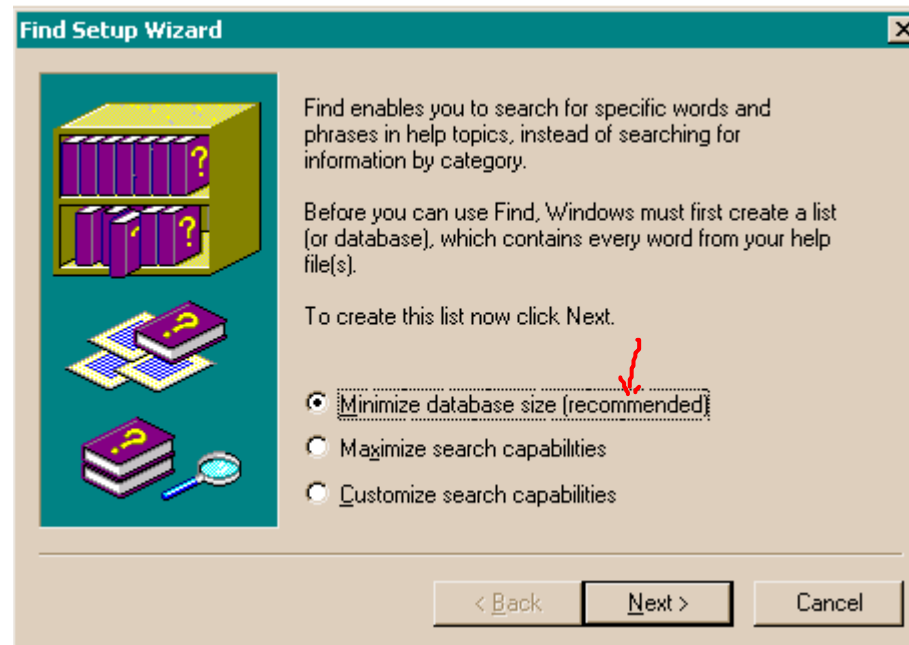

(“invisible sheets” in Excel)

# Choices

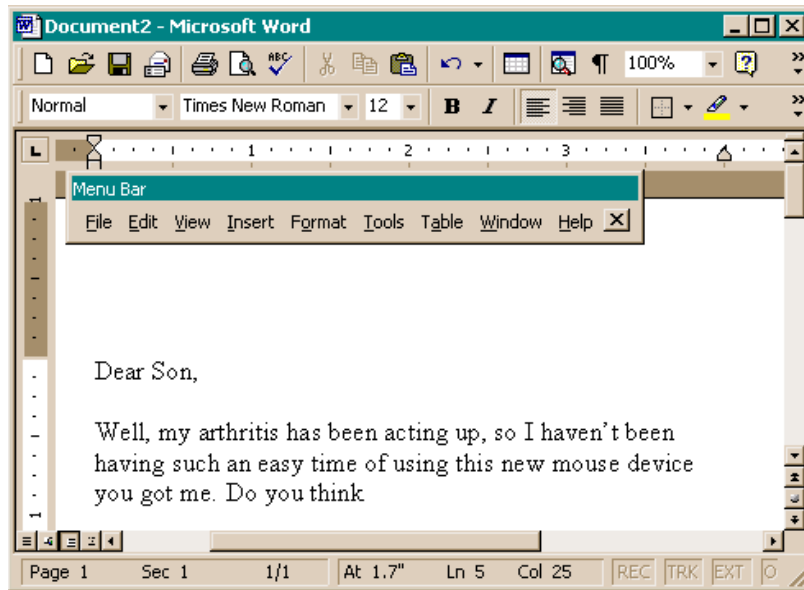

- “Every time you provide an option, you're asking the user to make a decision.” – Joel Spolsky

**This is “unequivocally the most moronic ‘wizard’ dialog in the history of the Windows operating system. This dialog is so stupid that it deserves some kind of award. A whole new *category* of award.”**

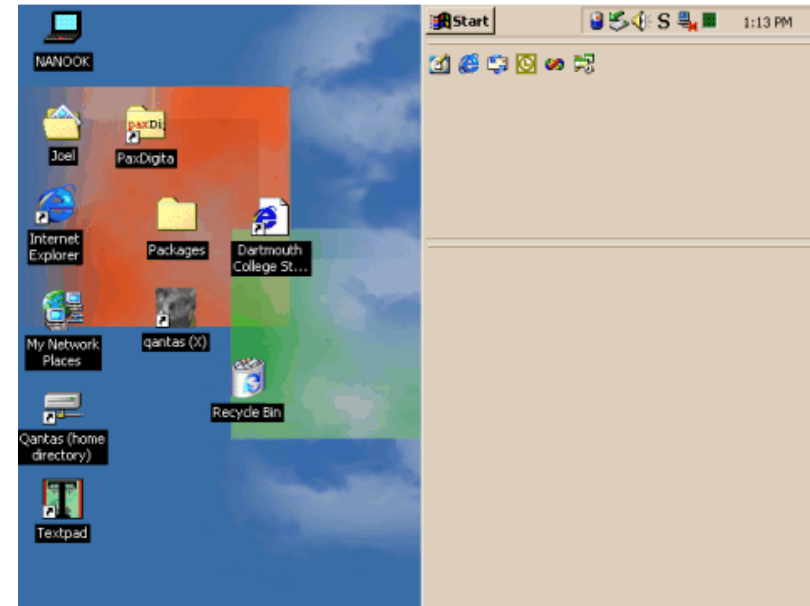

# Too much freedom is dangerous

**floating menu bar**

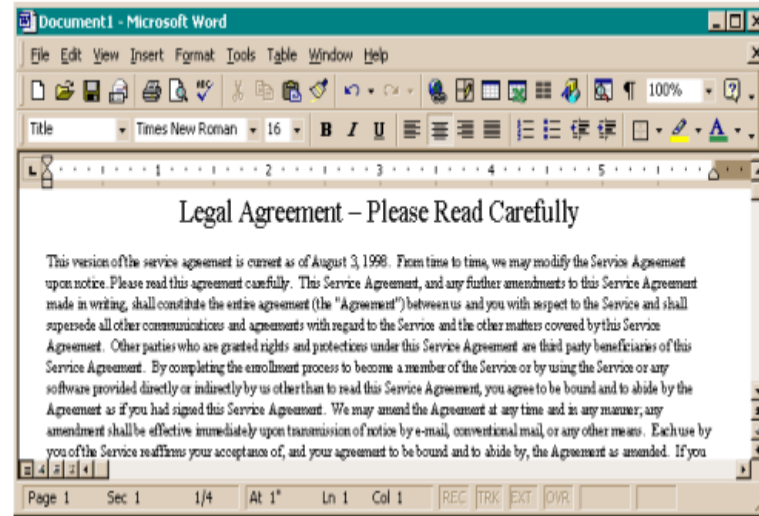

**huge system tray**

**How many users want these?**

# Metaphors

vs.

Also desktop, folders, paintbrush, ...

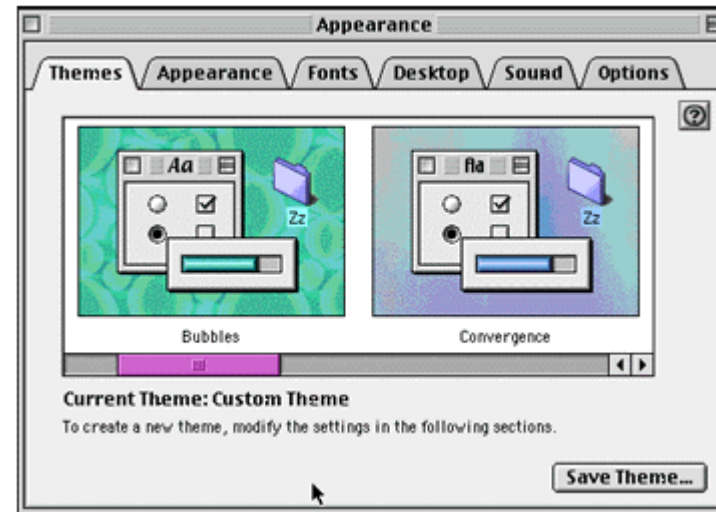

# Affordance

*afford* – to make available or provide naturally  
(door with metal plate *affords* pushing)

(30% usability)

VS.

(100% usability)

# Affordance (cont.)

**Where to grab?**

**Where to click?**

**What to drag?**

# Consistency, not creativity

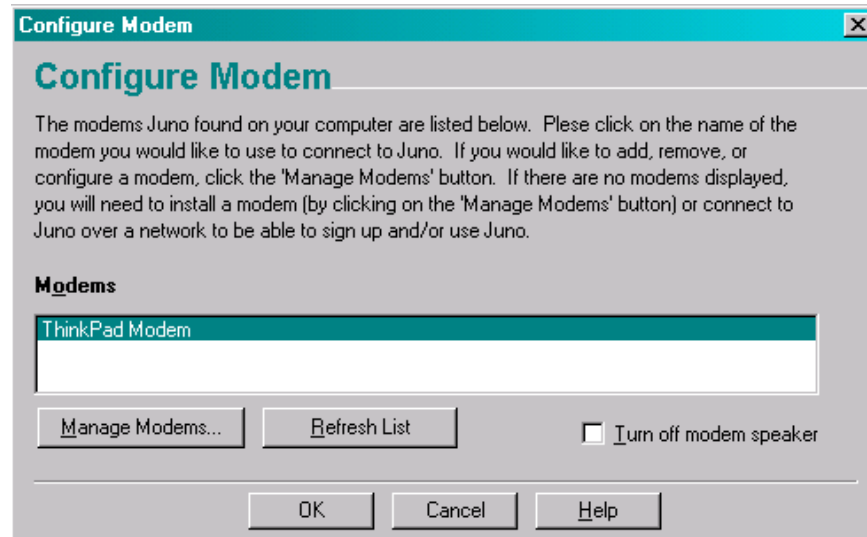

- “A *foolish* consistency is the hobgoblin of little minds” – Emerson
- Application should be consistent with itself *and* with other programs
- Examples: FrontPage, Visio
- Beware of creativity:
  - Less like user model
  - More work to implement
  - Do not leverage future/hidden features
  - “Just because Microsoft does it, doesn't mean it's right”
  - Examples: Tab from name to password, Netscape’s reimplementations of common controls

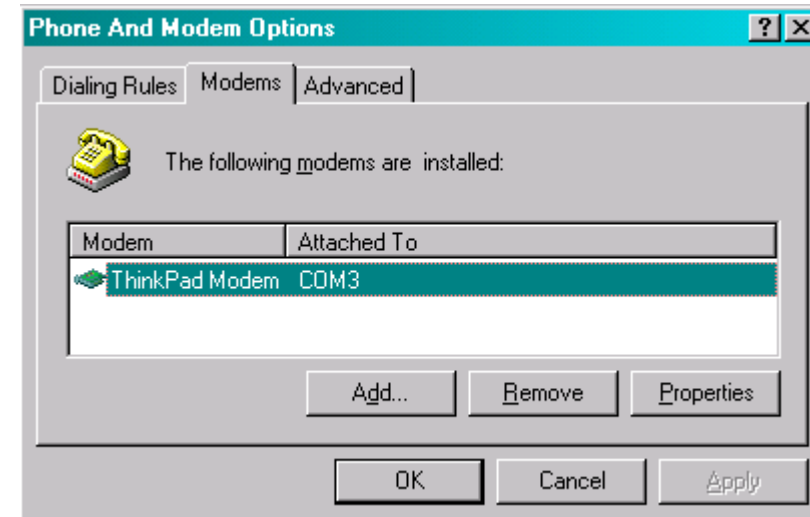

# Make explanations brief

- “Users don’t read the manual” – Spolsky
  - May not have the manual (on airplane, demo version)
  - Too busy / distracted / impatient
- “Users don’t read anything” – Spolsky
  - advanced too busy
  - novice hope defaults are ok
  - in-between try to read but get confused

vs.

# Many users are intimidated by computers

**vs.**

**vs.**

**(no dialog)**

**Which is better for an intimidated user?**

# Users can't control the mouse well

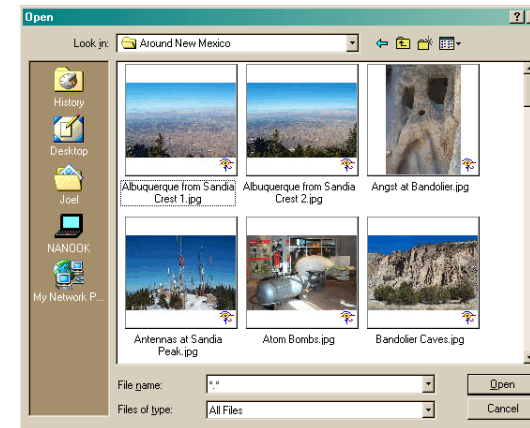

- What's the problem?
  - sub-optimal pointing devices
  - bad conditions (dirty, old, or cheap mouse; crowded desk)
  - medical disabilities (young, old, arthritis, ...)
  - in a hurry
- “Mile-high menu bar”
  - Macintosh: slam mouse to top, get menu
  - Windows:  $\frac{1}{2}$  by  $\frac{1}{4}$ -inch target
- Easiest places to point: four corners
  - (Windows 95 start menu blunder: 2 pixels from corner)
- Programmers generally stick to 0, 1, or n
  - They want to avoid magic numbers (Why can you only open 20 windows?)
  - But all  $n > 1$  are not equally likely  
(window close to edge should snap in place)

# Don't tax the user's memory

- Make objects, actions, and options visible
- User should not have to remember (too much) information

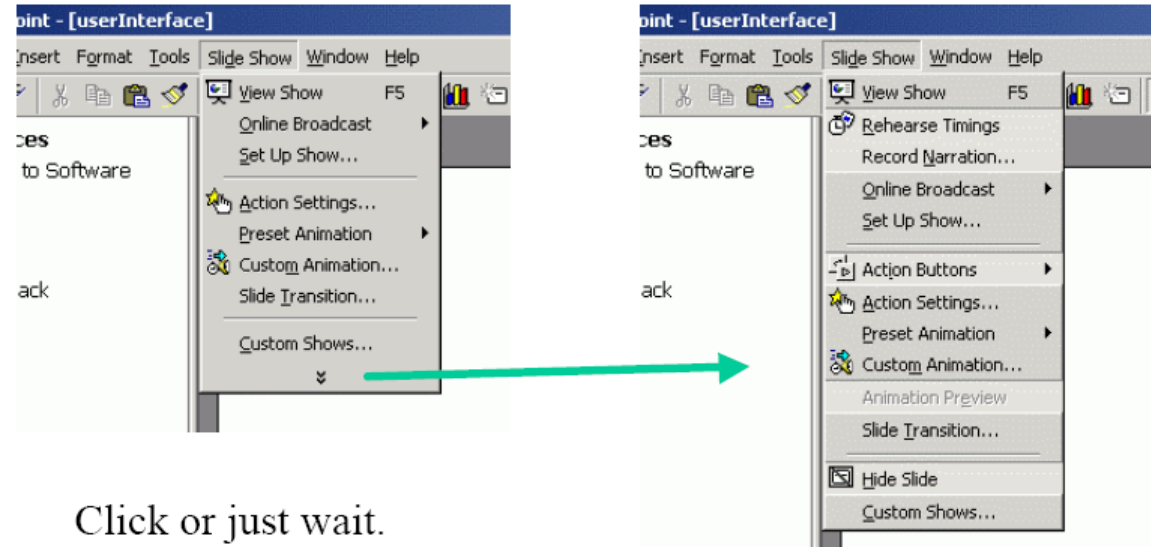

Book1					
	A	B	C	D	E
1	Name	Age	Sex		
2	Joel		23 Male		
3	Jenine		29 Female		
4	Micah		39 Male		
5

7					

I think I may |

May 8, 2000

# Some bad designs

**adaptive  
menu**

**office  
“assistant”**

**What principle  
is being violated?**

# The bell curve

- Users lie on a bell curve
  - 98% can use a TV
  - 70% can use Windows
  - 15% can use Linux
  - 1% can program
- Users are not dolts
- But, the easier you make the program, the more people can use it (10% more usable → 50% more users)

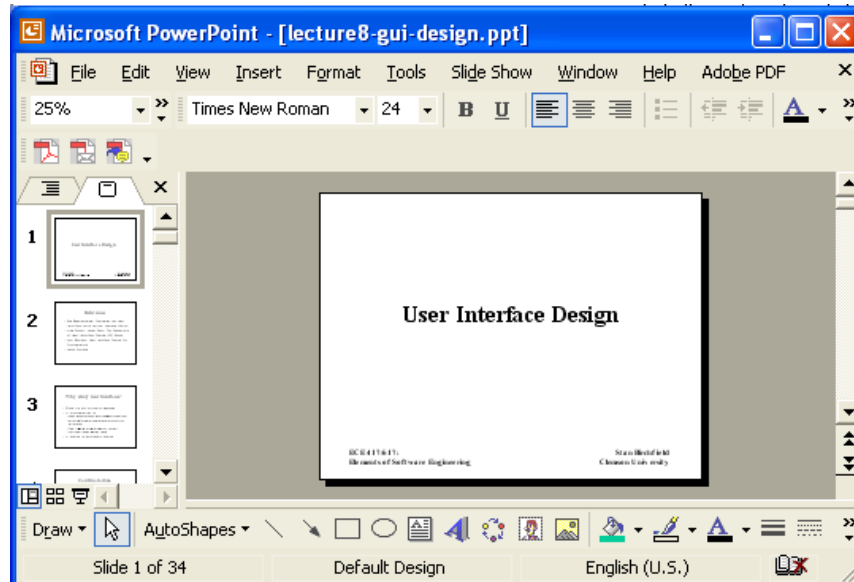

# Activity-based UI

- Two ways of designing UI:
  - What features should be there?
    - Greeting card example: add text, add picture, get predesigned card from library, send by email, print
  - What activities will users do?
    - Greeting card example: birthday greeting, party invitation, anniversary greeting  
(leads to unexpected features: remind to send next year)
- Example:
  - Excel was designed for financial number-crunching, but many use it for lists
  - Improv was to be “killer app” for NeXT
    - great for complicated multi-dimensional financial models
    - painful for lists

# Open-ended vs. sequential operation

- History of UI goes back-and-forth b/w
  - user-in-control (command-line, Word, ...)
  - sequential steps (wizards, ...)

VS.

# Visual perception

**color  
constancy**

Edward H. Adelson

**font spacing:**

323 Fillmore Street

323 Fillmore Street

**color-blind:  
8% of men,  
0.5% of women**

**[from Michael Black]**

# Web-safe colors

**216 can be reproduced on  
all displays (including 8-bit)**

**dithering may produce  
other colors**

# Dangers of color

**Driving at night in San Jose, where the street lights are yellow**

**traffic light  
is green**

**traffic light  
is yellow**

# WHAT DOES A UX DESIGNER DO?

C<sub>1</sub> C<sub>2</sub> C<sub>3</sub> C<sub>4</sub>

- Competitor analysis
- Customer analysis and user research
- Product structure and strategy
- Content development
- Prototyping and wireframing
- Testing and iteration
- Coordination with UI designer(s)
- Coordination with developer(s)
- Analysis and iteration

# wireframe

# Beyond WIMP

- WIMP (windows, icons, menus, pointers)
- WYSIWYG is WYSIAYG
- Importance of language
  - grouping, conditionals, referring to objects not immediately visible or future
  - support novice and power-user
  - provide concrete and abstract ways of manipulation
  - keyboard shortcuts / macros
- Shared control
  - Delegation of routine or complex tasks to computer

# Design Thinking

is a design methodology that provides a solution-based approach to solving problems. It's extremely useful in tackling complex problems that are ill-defined or unknown,

- by understanding the human needs involved, by re-framing the problem in human-centric ways,
- by creating many ideas in brainstorming sessions
- by adopting a hands-on approach in prototyping and testing.

# Empathize

demands gaining an empathic understanding of the problem you're trying to solve, typically through some form of user research.

Empathy is crucial because it allows you to set aside your own assumptions about the world in order to gain insight into users and their perspectives. This stage involves entering the realm of the users and, as far as possible, “becoming” them so as to begin work on custom-designing a solution.

# Define

During the Define stage of Design Thinking, you put together the information you have created and gathered during the Empathize stage. You analyze your observations and synthesize them in order to define the core problems you and your team have identified so far. This is where you ensure that what you are addressing sits in sharp relief before you, its properties known in full.

# Ideate

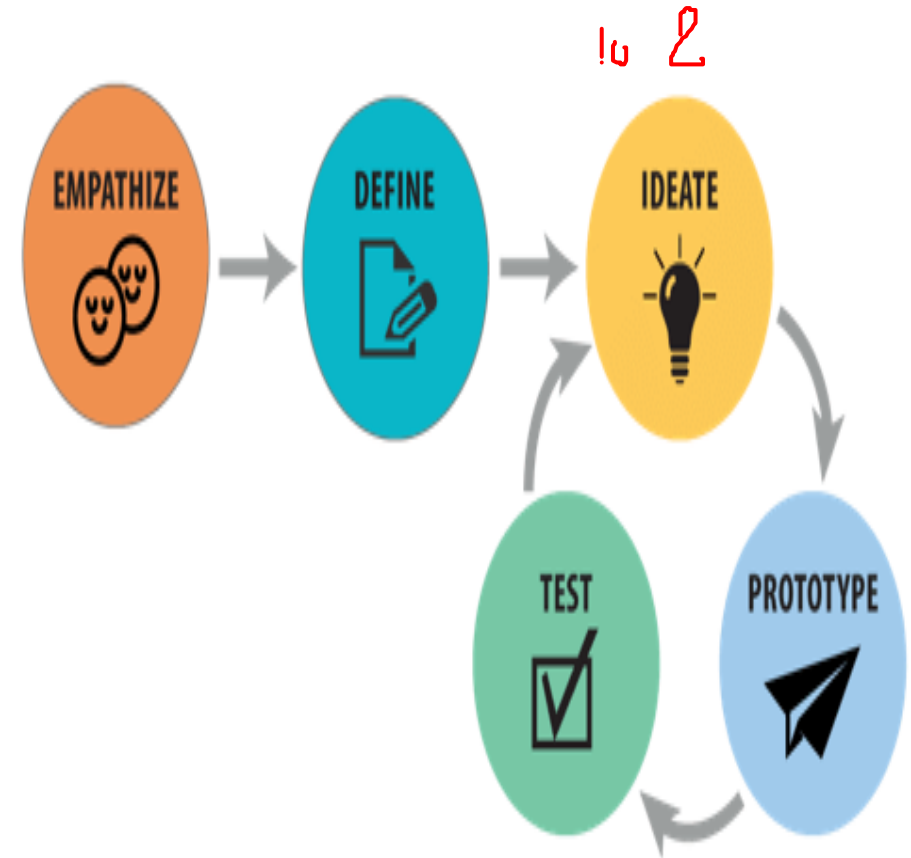

The process's third stage finds you ready to start generating ideas.

With the knowledge you have gathered in the first two phases, you can start to “think outside the box” to identify new solutions to the problem statement you’ve created, and you can start to look for alternative ways of viewing the problem.

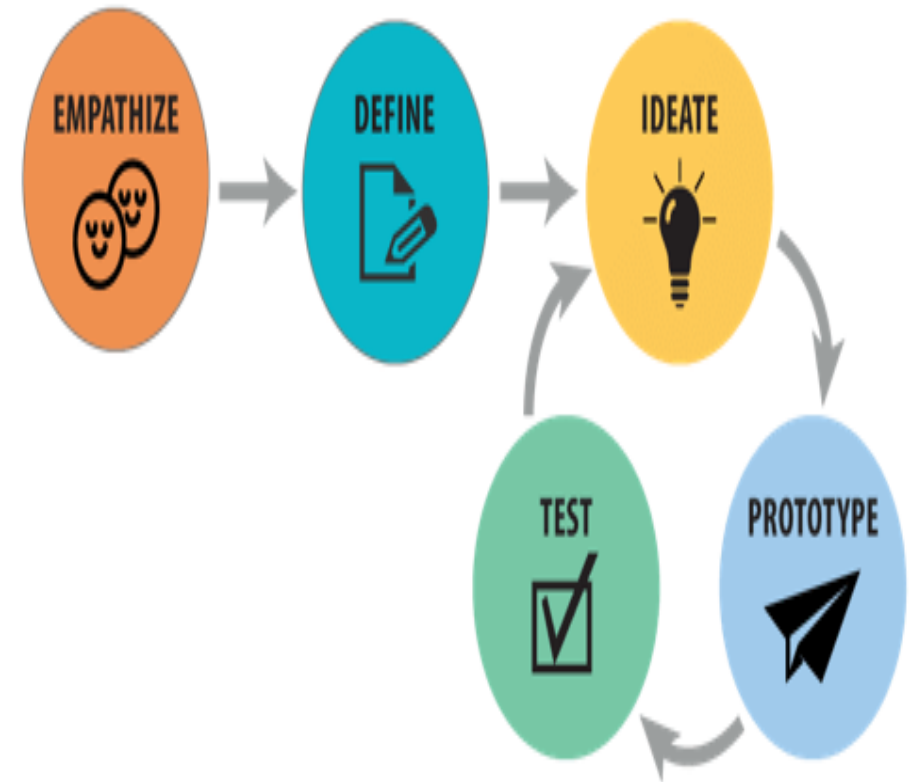

# Prototype

- In the Prototype phase of Design Thinking, your design team produce a number of inexpensive, scaled-down versions of the product or specific features found within the product so you can investigate the problem solutions generated in the previous stage.

# Test

- In the Test phase of Design Thinking, you rigorously test the completed product using the best solutions identified during the prototyping phase. This is the final stage; however, in an iterative process, the results generated during the testing phase are what you will often use to redefine one or more problems.

# Perspectives on Design Thinking

- the importance of ~~empathy~~. Empathy is about stepping out of your own role and try to understand the perspective of others. In Perspectives we will particularly ask the questions what the goals and responsibilities of the stakeholders are and which information they need to realise them.
- a fast iteration of Ideate, Prototype and Test. Using the Perspectives Software it is possible to both generate prototypes of the stakeholder's perspectives and validate them during workshops. This will improve the workshop's dynamics and the quality of the result. It will be interesting to see how Perspectives can be used in Design Thinking workshops.

# Design Thinking Examples

When people think of IBM, the first thing that comes into their mind is technology, business, and computers. As their former CEO Thomas Watson Jr. declared, “Good design is good business”, IBM has invested heavily in design thinking. They started holding empathy map sessions and kept users in mind while designing processes and products. Consequently, they have witnessed significant ROIs with this change in approach. They have also made it openly available.

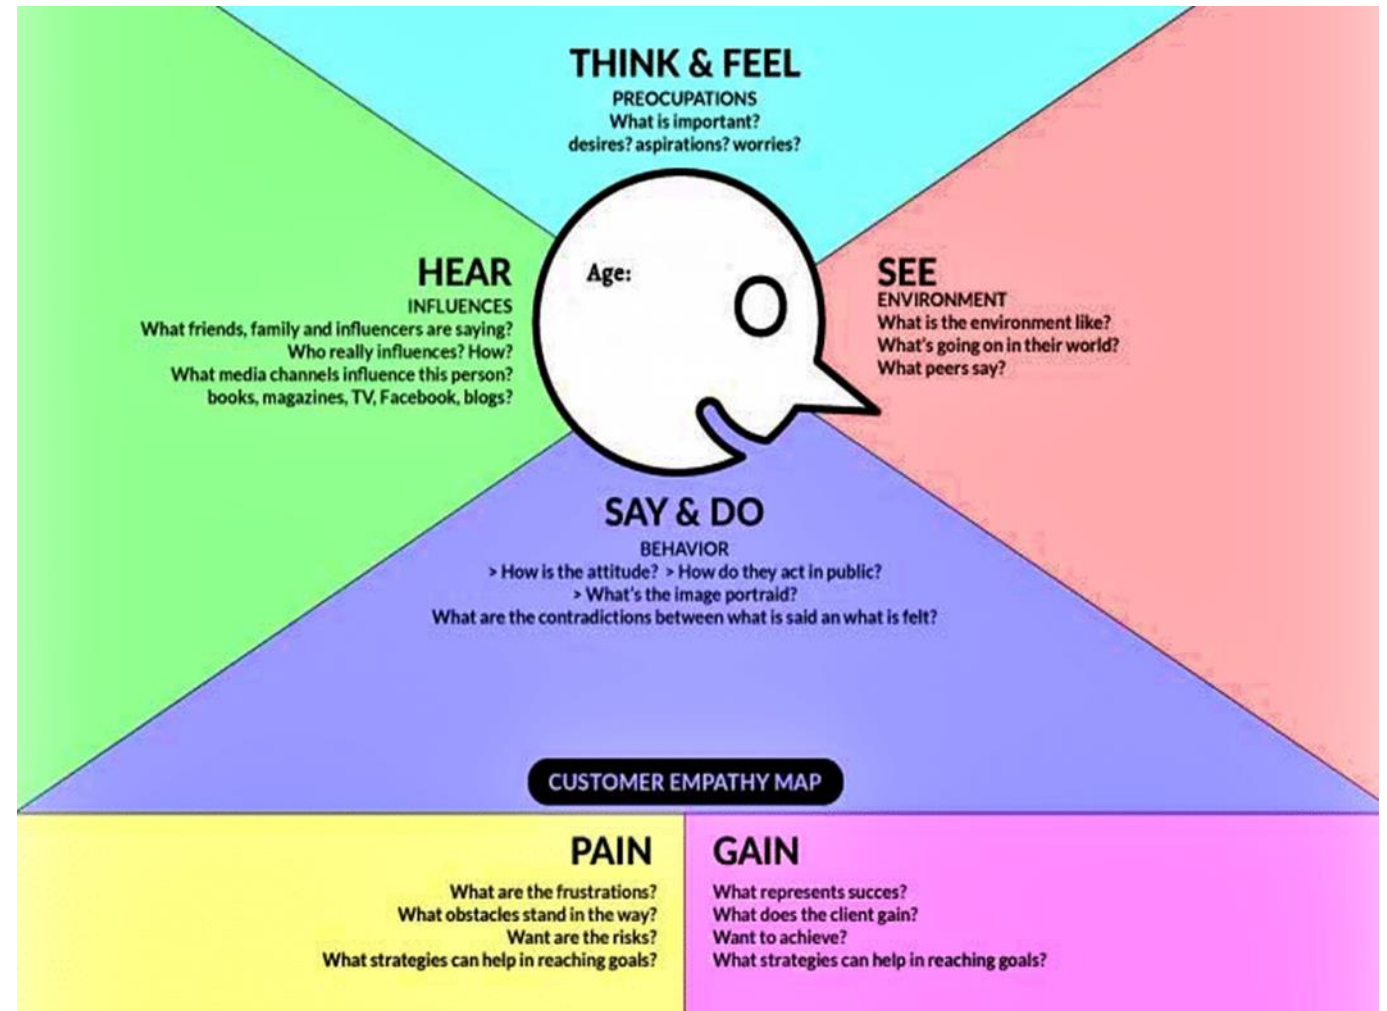

# Uber

Uber is another famous design thinking example. With the help of design thinking and a user-focused approach, it eliminated simple problems that had been plaguing customers in the past. It introduced features such as cashless payments, another great design thinking process example, to make transactions straightforward and reduce the chances of fraudulent activities. By providing the power to give ratings for both drivers and users, it increased the incentive for good behavior. Simple design tweaks, aided by a substantial user understanding, helped Uber pivot itself to the behemoth it has become today. It is one of the best design thinking problem statement examples.

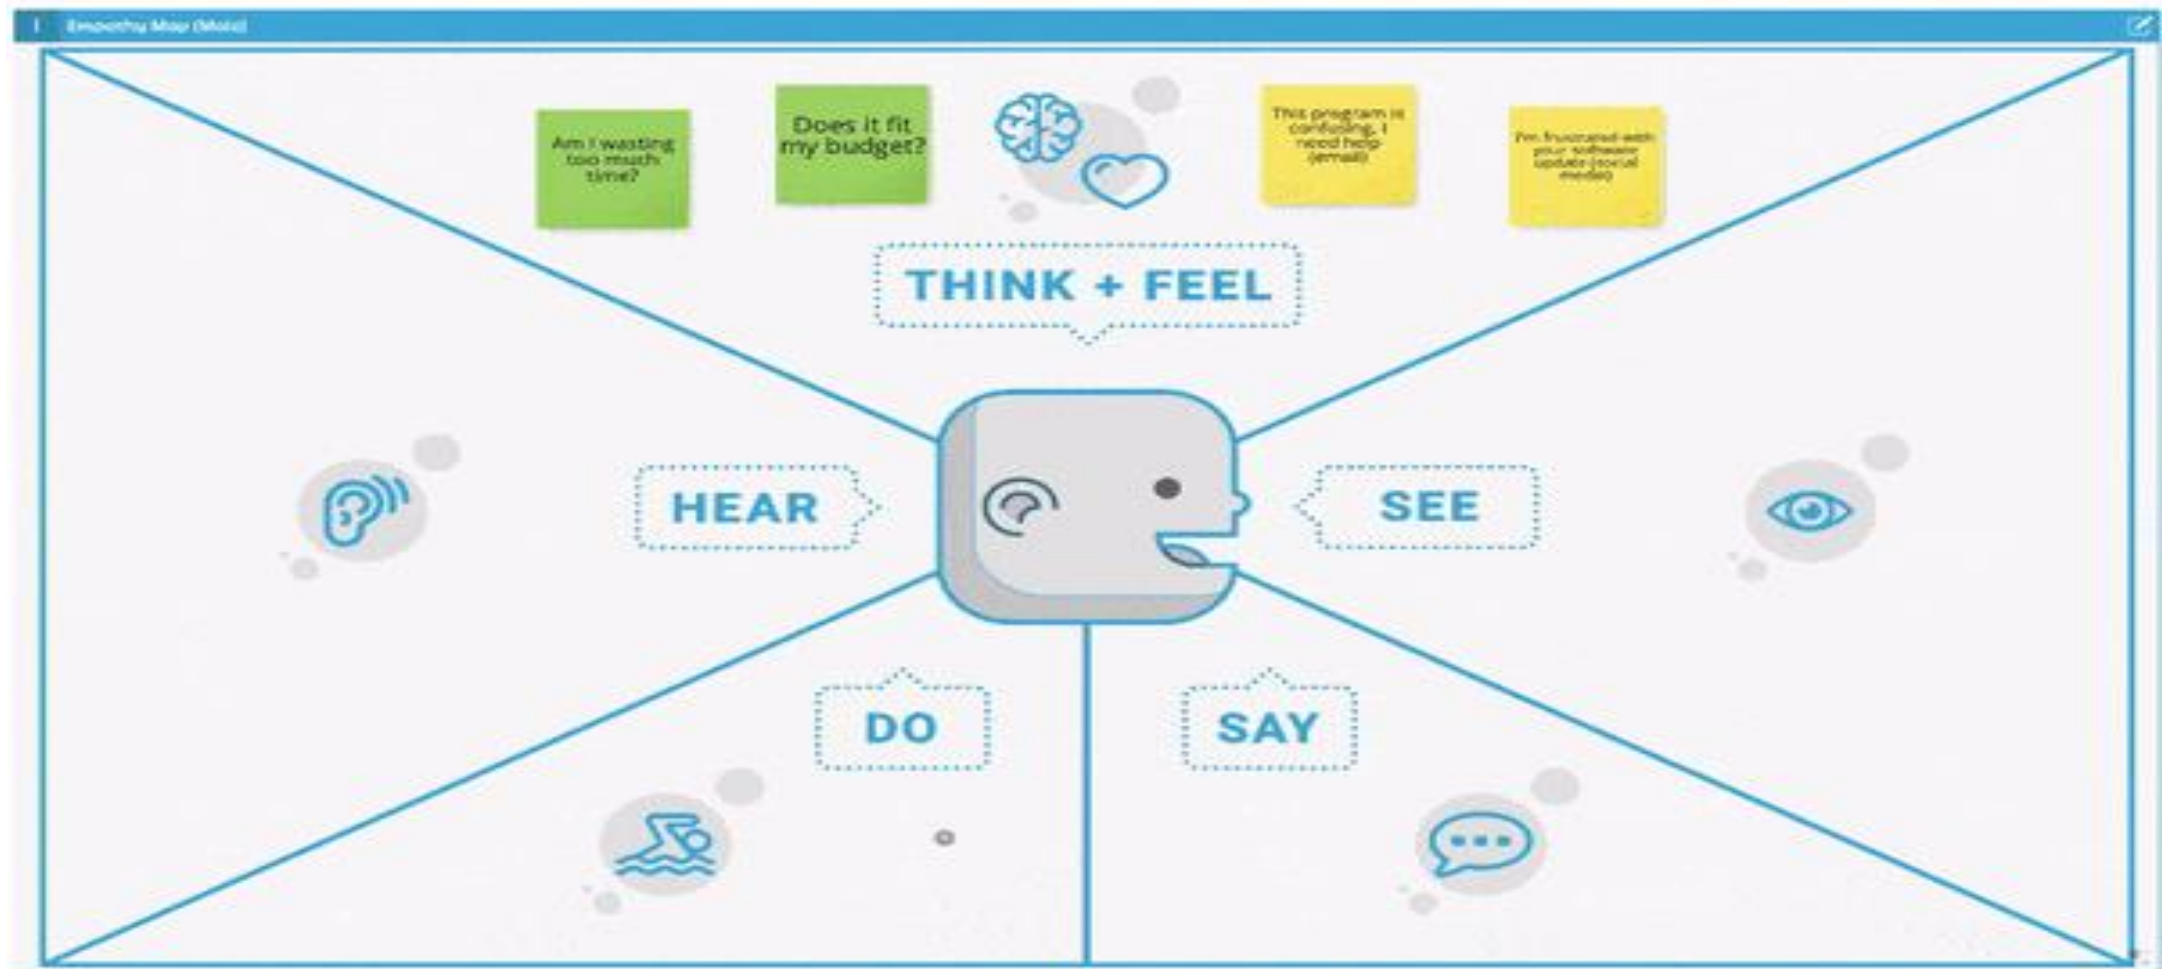

# Customer Empathy Map

Empathy Mapping is a visual tool that is designed to show detailed insights into how customers feel about your product or service, and if they think it's sustainable for them.

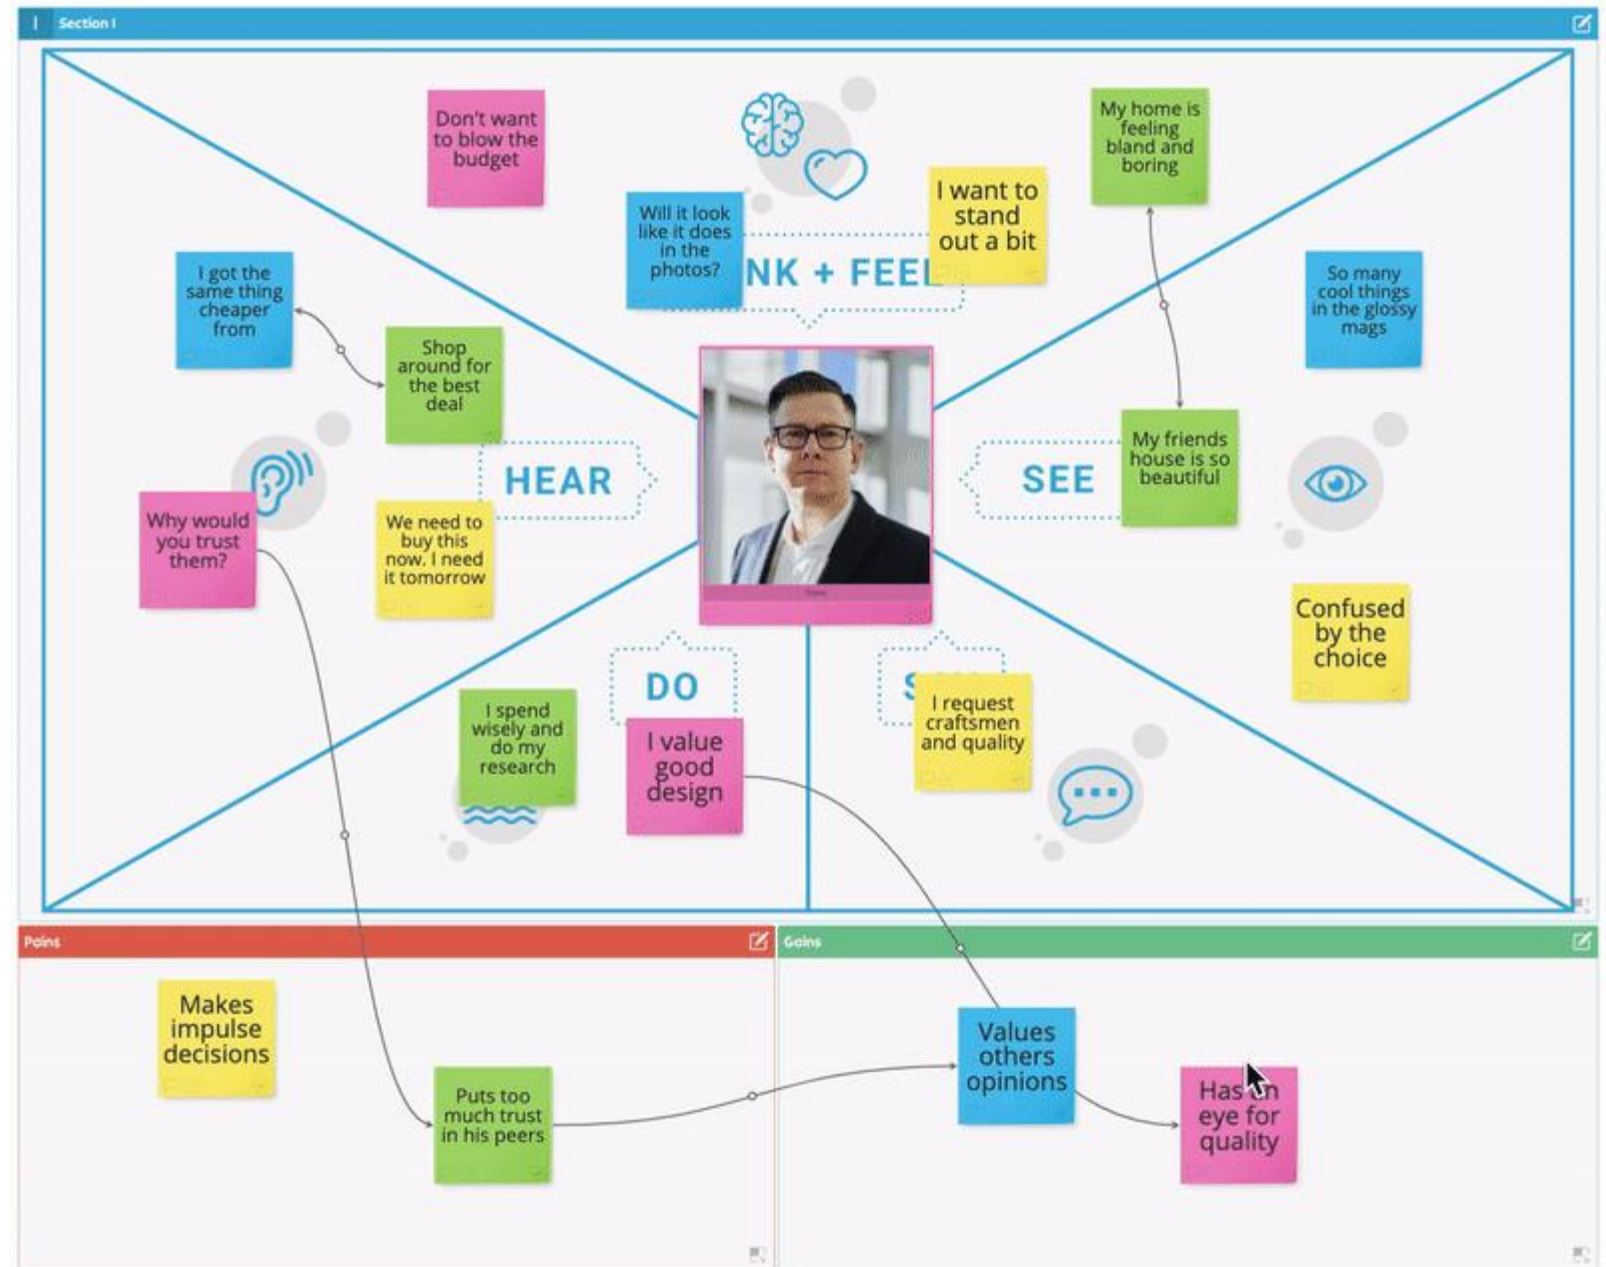

# Empathy Mapping

## Empathy Map: John Q. Customere

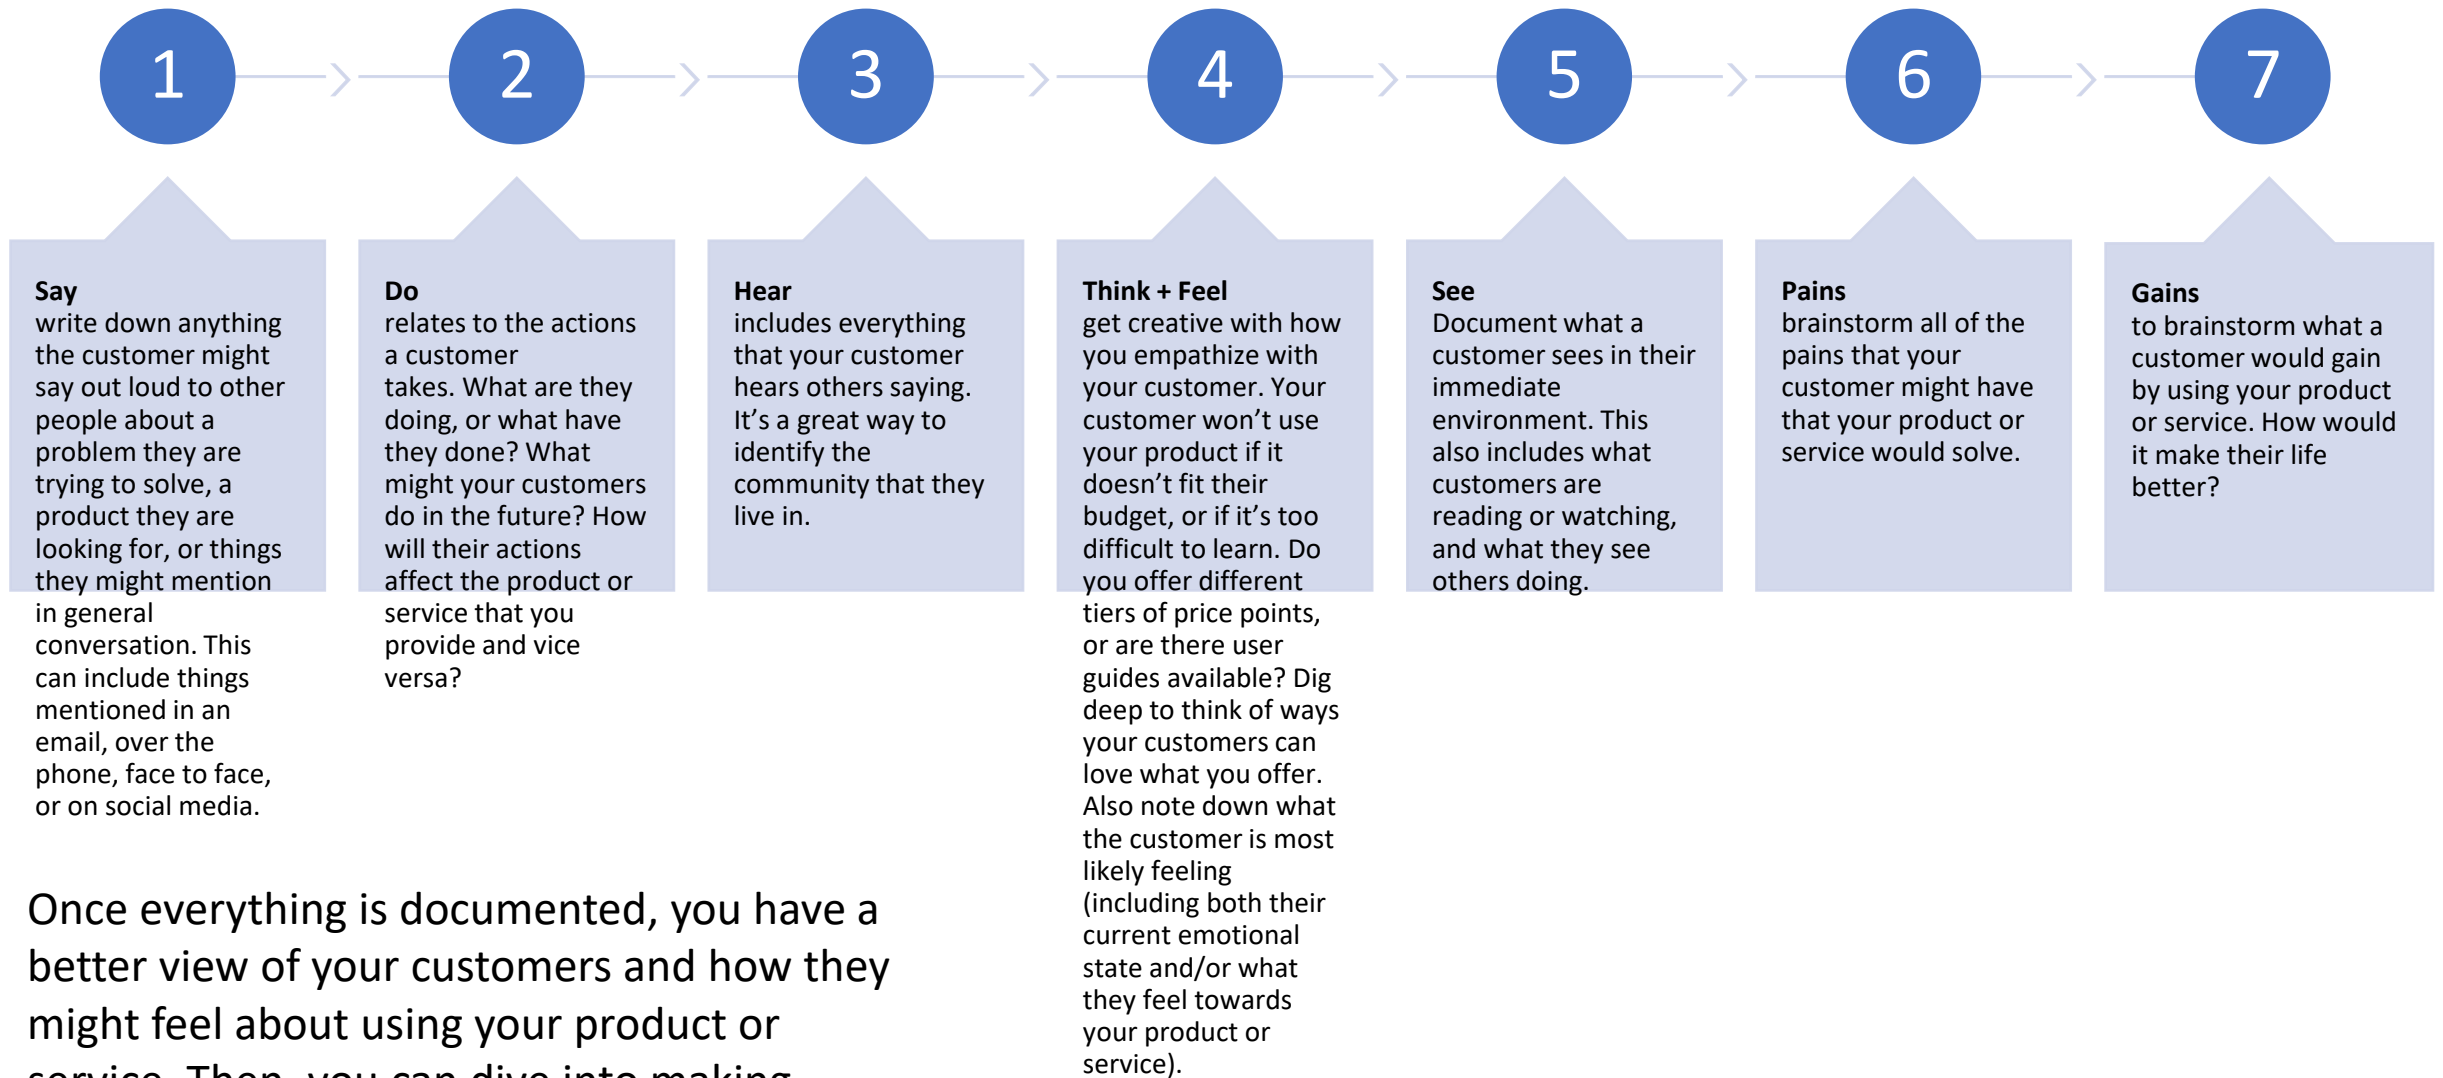

# Empathy Mapping

# get started with this template

- an Empathy Map looks like a basic chart containing four different sections, including *'Say'*, *'Think'*, *'Do'*, and *'Feel'*. These four sections represent what your customers are saying, thinking, doing, and most importantly, feeling.
- The Stormboard template includes the sections Say, Do, Hear, Think + Feel, See, and also includes Pains and Gains sections for extra information on your customers.

Once everything is documented, you have a better view of your customers and how they might feel about using your product or service. Then, you can dive into making changes and adjustments if needed.

# Customer Journey Map - Alternative

Visualize all of the places, or touchpoints, that your customer comes in contact with your company, product, or service both online and off with the Customer Journey Map Template.

To make it easy for you to understand what motivates your customers to ultimately make a purchase, the template is set up with four rows that help you identify what your customers are Doing, Thinking, and Feeling, plus any Opportunities that are there for you and your team. The columns in this template can be customized to suit your needs.
